

App Administrator Quick Guide

A concise handover guide for the person responsible for Electrical Open.

The three services

- The app is hosted on Cloudflare Pages: `electrical-open.pages.dev`. A push to the main branch of the GitHub app repository deploys the app automatically.
- Supabase holds the database, user accounts, roles, notifications and server functions.
- GitHub holds the source code and the encrypted weekly database backup workflow

Do not share Supabase service keys, database passwords, backup passphrases or GitHub access tokens in messages, email or the app.

Everyday administration

- 1 Keep the season member list and fixture participant lists current.
- 2 Create fixtures first, add course details and participants, then allow score entry.
- 3 Before completing a fixture, make sure every participant is either Manual, Verified or NR. Enter the PCC, then Finalize & commit. Order of Merit points are only awarded when the fixture is committed.
- 4 Use the Help Centre in the app for the membership guide and administrator resources.

User accounts and access

- A player and an app account are separate until linked. The phone symbol in member lists means the link exists.
- Only the highest-level administrator should use Invite app member. The invitation sends an eight-digit setup code; the member chooses their own password.
- Membership administrators can maintain members, fixtures and participants. They should not alter course details, scorecards, results, roles or technical settings.
- Administrator roles are stored in Supabase in `public.user_roles`. Before changing a role, record who has it and why. Keep at least two trusted highest-level administrators.

Backups

- GitHub Actions runs Encrypted Supabase backup every Sunday at 02:17 UTC. It saves a 90-day encrypted copy in Actions and an encrypted copy in the private backup repository.
- If the Supabase database password is changed, update the `SUPABASE_DB_PASSWORD` GitHub secret straight away or backups will fail.
- Keep the `BACKUP_PASSPHRASE` in a shared password manager. Test a restore into a separate test project at least once a year; never test a restore over the live project.

If the app stops working

- 1 Check Cloudflare Pages deployment status for the latest main branch commit.
- 2 Check the browser error and Supabase Logs / Edge Function logs if the problem concerns sign-in, invitations, notifications or scorecard scanning.
- 3 Do not delete tables, players or fixtures to solve an error. Make a backup first and ask for help with the exact error message and a screenshot.
- 4 If a bad code change is deployed, use GitHub to revert the commit or redeploy the previous known-good main branch commit.

Annual handover

Hand over access to the app, GitHub, Cloudflare and Supabase; the shared password-manager entry; names of other administrators; and this guide. Confirm a recent backup first.
